Introducing the Healthy Nightlife Toolbox project

The HNT-project is an international project focussing on the reduction of harm from alcohol and drug use among young people. To date, preventive actions in nightlife are mostly sporadic, often not based on evidence and not evaluated. Therefore, the general objective of the HNT project is to support the identification and implementation of effective interventions (prevention, "early intervention", treatment et cetera) in this setting. Results will be presented in an updated web-based toolbox which also includes databases with literature.

The first version of the HNT Toolbox was between 2008 and 2010 in cooperation between partners from Belgium, Hungary, Spain, The Netherlands and The United Kingdom, supported by the EU. Now, in 2016, under its EU Presidency, the Dutch government financially supports the update of this Toolbox. The EMCDDA offered to host the site and will take care of future accessibility and maintenance. From July 2016 the updated Healthy Nightlife Toolbox will inform local, regional and national policy-makers and prevention workers in the EU on evidence based and best practice interventions in nightlife.

Aim of this questionnaire

This questionnaire has been developed in order to identify interventions suitable for the HNT-toolbox. Interventions should be understood as every programme, project, training method, policy, law enforcement strategy, form of treatment, supervision et cetera developed for and implemented in a nightlife setting in order to reduce and prevent harm from alcohol and other drugs. Please note that for this project we are looking for evaluated interventions only. By means of this short questionnaire we aim to determine which interventions meet our standards and come in view for the HNT-database. If your intervention is selected for the database, you will be invited to fill in another questionnaire, asking for more details about the intervention.

We thank you for your cooperation!
